Executive Summary: Air Quality in Our Area

Air Quality in West Lindsey District Council

Air pollution is associated with a number of adverse health impacts. It is recognised as a contributing factor in the onset of heart disease and cancer. Additionally, air pollution particularly affects the most vulnerable in society: children and older people, and those with heart and lung conditions. There is also often a strong correlation with equalities issues, because areas with poor air quality are also often the less affluent areas^{1,2}.

The annual health cost to society of the impacts of particulate matter alone in the UK is estimated to be around £16 billion³.

Although there was an increase in the annual mean NO₂ concentration in 2017 at all sites, the concentrations of nitrogen dioxide (NO₂) recorded within the District in 2017 were well below the Air Quality Standard (AQS) objectives. There has not been a recorded exceedance of any AQS objectives within the District in the past five years. West Lindsey is mostly rural in nature and the main source of pollution is vehicle emissions from the existing road network, most notably the A15, A46 and the A631.

There are three power stations operated by EDF Energy within the neighbouring District of Bassetlaw to the west of West Lindsey; Cottam and West Burton A are both coal fired power stations, and West Burton B is a gas fired combined cycle gas turbine (CCGT) power station. Due to the close proximity of the three power stations to each other an automatic air quality monitoring station is located in Gainsborough, north to north east of the location of the power stations to continuously monitor both NO₂ and sulphur dioxide (SO₂).

There are currently no Air Quality Management Areas (AQMAs) within the District. This is due to the low concentrations that are currently, and have historically been monitored. The monitoring network is to remain in place to continually assess a number of identified areas against the AQS objectives, these locations will be reviewed in the event of a hotspot area of pollution being identified. The results show

¹ Environmental equity, air quality, socioeconomic status and respiratory health, 2010

² Air quality and social deprivation in the UK: an environmental inequalities analysis, 2006

³ Defra. Abatement cost guidance for valuing changes in air quality, May 2013

that all AQS objectives for SO₂ continue to be met at the Gainsborough Cemetery monitoring location.

Actions to Improve Air Quality

There are currently no designated AQMAs within the District and therefore an AQAP is not required. The air quality across West Lindsey is considered to be good, and as such there are no specific measures related to the control and mitigation of sources of local air pollution currently in place.

West Lindsey will continue to monitor for the coming year within the NO₂ diffusion tube network and to assess the results along with the results from the automatic monitoring station operated by EDF Energy at Gainsborough.

The adopted Central Lincolnshire Local Plan contains objectives and policies designed to minimise the impact upon local air quality from new developments.

Conclusions and Priorities

Being a rural district without any substantial urbanised areas, the pollution concentrations continue to be relatively low and monitoring will continue to ensure that any concentration trends can be identified.

West Lindsey will continue to assess new developments submitted through the planning department ensuring that any proposed developments are not detrimental to local air quality. In addition, any new industry will be permitted in line with The Environmental Permitting (England and Wales) Regulations 2010.

Local Engagement and How to get Involved

A number of initiatives can be completed by everyone to help reduce air pollution concentrations on a local scale, these include:

- Using alternative modes of transport rather than the car, walking, cycling or using public transport;
- Changes in transport modes can bring added health benefits through walking and cycling exercise; and
- Asking your employer, school or college about the possibility of developing a green travel plan.

1 Local Air Quality Management

This report provides an overview of air quality in West Lindsey during 2017. It fulfils the requirements of Local Air Quality Management (LAQM) as set out in Part IV of the Environment Act (1995) and the relevant Policy and Technical Guidance documents.

The LAQM process places an obligation on all local authorities to regularly review and assess air quality in their areas, and to determine whether or not the air quality objectives are likely to be achieved. Where an exceedance is considered likely the local authority must declare an Air Quality Management Area (AQMA) and prepare an Air Quality Action Plan (AQAP) setting out the measures it intends to put in place in pursuit of the objectives. This Annual Status Report (ASR) is an annual requirement showing the strategies employed by West Lindsey Council to improve air quality and any progress that has been made.

The statutory air quality objectives applicable to LAQM in England can be found in Table E.1 in Appendix E.

2 Actions to Improve Air Quality

2.1 Air Quality Management Areas

Air Quality Management Areas (AQMAs) are declared when there is an exceedance or likely exceedance of an air quality objective. After declaration, the authority must prepare an Air Quality Action Plan (AQAP) within 12-18 months setting out measures it intends to put in place in pursuit of compliance with the objectives.

Currently there are no AQMAs designated within West Lindsey.

The monitoring completed within the District presented in Appendix A continues to comply with the air quality objectives, therefore no AQMA designations are proposed.

2.2 Progress and Impact of Measures to address Air Quality in West Lindsey District Council

There are several industries in the district with the potential to pollute that are controlled by Environmental Permits. These industries have their emissions controlled by a range of legally enforceable conditions. These processes are subject to regular routine inspection. The Environmental Protection team also responds to complaints regarding other air pollution issues, such as smoke nuisance from bonfires, emissions of dark smoke and offensive odours.

West Lindsey will continue to assess new developments submitted through the planning department ensuring that any proposed developments are not detrimental to local air quality. In addition, any new industry will be permitted in line with The Environmental Permitting (England and Wales) Regulations 2010.

2.3 PM_{2.5} – Local Authority Approach to Reducing Emissions and/or Concentrations

As detailed in Policy Guidance LAQM.PG16 (Chapter 7), local authorities are expected to work towards reducing emissions and/or concentrations of PM_{2.5} (particulate matter with an aerodynamic diameter of 2.5µm or less). There is clear evidence that PM_{2.5} has a significant impact on human health, including premature mortality, allergic reactions, and cardiovascular diseases.

Currently there is no monitoring of PM_{2.5} or PM₁₀ completed within West Lindsey, therefore no concentration values can be reported or estimated using the method as described in Box 7.7 of LAQM.TG(16).

The current Defra background maps for West Lindsey (2015 based⁴) show that all background concentrations of PM_{2.5} are far below the 2020 annual mean AQS objective for PM_{2.5}. The highest concentration is predicted to be 11.5µg/m³ within the 1 x 1km grid square with the centroid grid reference of 481500,390500. This is an area to the northwest of Gainsborough Central.

There is currently one designated smoke control zone within West Lindsey, the Lincoln Fringe (the area between the boundary of the West Lindsey District and Lincoln bypass). Details on the smoke control area and the order governing the zone are available within the air quality section of the website for West Lindsey⁵.

The Public Health Outcomes Framework data tool⁶ compiled by Public Health England quantifies the mortality burden of PM_{2.5} within England on a county and local authority scale. The 2016 fraction of mortality attributable to PM_{2.5} pollution across England is 5.3%, and in contrast the fraction within West Lindsey is slightly lower than the National average at 5.1%.

LAQM.TG(16) Table A.1 Action toolbox presents a list of measures that can be implemented to help reduce concentrations of PM_{2.5}.

⁶ Public Health Outcomes Framework, Public Health England. data tool available online at <http://www.phoutcomes.info/public-health-outcomes-framework#page/0/gid/1000043/pat/6/par/E12000004/ati/101/are/E07000142>

West Lindsey District Council

Where required West Lindsey will review any proposed actions to be implemented with the County Council Public Health team to consider the potential impact of the actions and whether any further action is required.

3 Air Quality Monitoring Data and Comparison with Air Quality Objectives and National Compliance

3.1 Summary of Monitoring Undertaken

3.1.1 Automatic Monitoring Sites

This section sets out what monitoring has taken place and how it compares with objectives.

West Lindsey District Council undertook automatic (continuous) monitoring at one site during 2017. Table A.1 in Appendix A shows the details of the site. The Gainsborough Cemetery site is operated by EDF Energy as part of a monitoring network to monitor emissions from the 'North Trent' group of power stations.

The results from the Gainsborough Cemetery monitoring site are not currently available online however national monitoring results are available at <https://uk-air.defra.gov.uk/networks/>.

Maps showing the location of the monitoring sites are provided in Appendix D. Further details on how the monitors are calibrated and how the data has been adjusted are included in Appendix C.

3.1.2 Non-Automatic Monitoring Sites

West Lindsey District Council undertook non- automatic (passive) monitoring of NO₂ at 12 sites during 2017. Table A.2 in Appendix A shows the details of the sites.

Maps showing the location of the monitoring sites are provided in Appendix D. Further details on Quality Assurance/Quality Control (QA/QC) for the diffusion tubes, including bias adjustments and any other adjustments applied (e.g. "annualisation" and/or distance correction), are included in Appendix C.

3.2 Individual Pollutants

The air quality monitoring results presented in this section are, where relevant, adjusted for bias, "annualisation" and distance correction. Further details on adjustments are provided in Appendix C.

3.2.1 Nitrogen Dioxide (NO₂)

Table A.3 in Appendix A compares the ratified and adjusted monitored NO₂ annual mean concentrations for the past 5 years with the air quality objective of 40µg/m³.

For diffusion tubes, the full 2017 dataset of monthly mean values is provided in Appendix B.

Table A.4 in Appendix A compares the ratified continuous monitored NO₂ hourly mean concentrations for the past 5 years with the air quality objective of 200µg/m³, not to be exceeded more than 18 times per year.

All monitoring locations continue to be well below the annual mean AQS objective for NO₂. The highest concentration in 2017 was 32.7µg/m³, this was recorded at the diffusion tube monitoring location WL7 which is located on Lea Road in Gainsborough.

Annual mean concentration graphs for NO₂ are presented in Figure A.1. The annual mean concentration recorded at the Gainsborough Cemetery automatic monitor has remained at a relatively constant concentration since 2013. For the diffusion tube concentrations, when compared to 2016, all the sites experienced an increase in concentration. The maximum increase in annual mean NO₂ concentration was 6.1µg/m³ recorded at WL7. All of the monitoring results were well below the AQS objective of 40µg/m³, therefore, no fall-off distance correction is required to be undertaken.

Table A.4 in Appendix A compares the ratified continuous monitored NO₂ hourly mean concentrations for the past 5 years with the air quality objective of 200µg/m³, not to be exceeded more than 18 times per year.

There have been no exceedances of NO₂ hourly mean objective in the last five years.

3.2.2 Sulphur Dioxide (SO₂)

Table A.5 in Appendix A compares the ratified continuous monitored SO₂ concentrations for 2017 with the air quality objectives for SO₂. The results show that all AQS objectives for SO₂ continue to be met at the Gainsborough Cemetery monitoring location.

Diffusion tube data has been bias corrected

Annualisation has been conducted where data capture is <75%

Notes:

Exceedances of the NO₂ annual mean objective of 40µg/m³ are shown in **bold**.

NO₂ annual means exceeding 60µg/m³, indicating a potential exceedance of the NO₂ 1-hour mean objective are shown in **bold and underlined**.

(1) Data capture for the monitoring period, in cases where monitoring was only carried out for part of the year.

(2) Data capture for the full calendar year (e.g. if monitoring was carried out for 6 months, the maximum data capture for the full calendar year is 50%).

(3) Means for diffusion tubes have been corrected for bias. All means have been “annualised” as per Boxes 7.9 and 7.10 in LAQM.TG16 if valid data capture for the full calendar year is less than 75%. See Appendix C for details.

Figure A.1 – Trends in Annual Mean NO₂ Concentrations

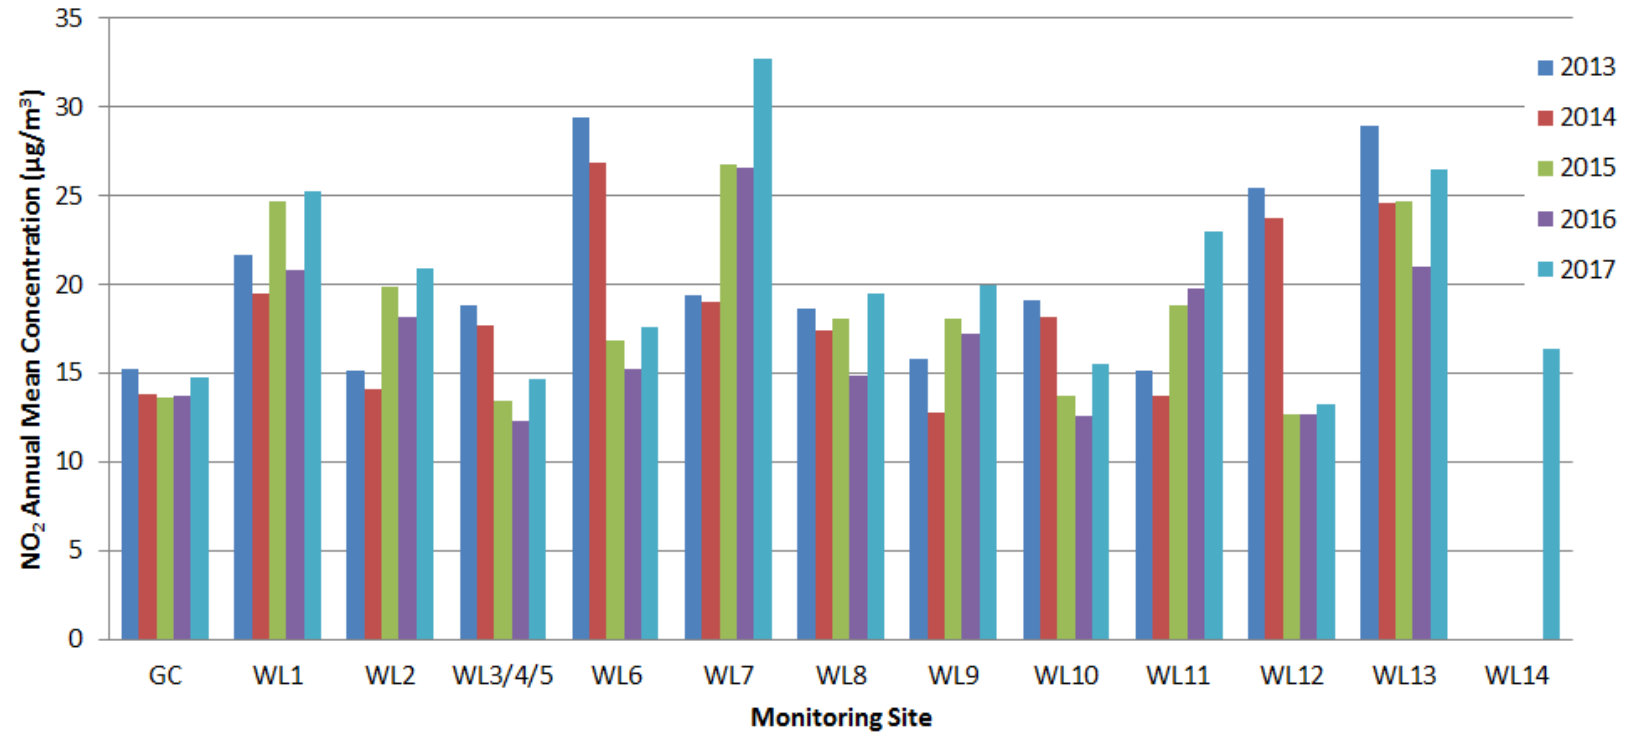

Table A.4 – 1-Hour Mean NO₂ Monitoring Results

Site ID	Site Type	Monitoring Type	Valid Data Capture for Monitoring Period (%) ⁽¹⁾	Valid Data Capture 2017 (%) ⁽²⁾	NO ₂ 1-Hour Means > 200µg/m ³ ⁽³⁾				
					2013	2014	2015	2016	2017
GC	Industrial	Automatic	100	100	0	0	0	0 (55.4)	0

Notes:

Exceedances of the NO₂ 1-hour mean objective (200µg/m³ not to be exceeded more than 18 times/year) are shown in **bold**.

(1) Data capture for the monitoring period, in cases where monitoring was only carried out for part of the year.

(2) Data capture for the full calendar year (e.g. if monitoring was carried out for 6 months, the maximum data capture for the full calendar year is 50%).

(3) If the period of valid data is less than 85%, the 99.8th percentile of 1-hour means is provided in brackets.

Table A.5 – SO₂ Monitoring Results

Site ID	Site Type	Valid Data Capture for monitoring Period (%) ⁽¹⁾	Valid Data Capture 2017 (%) ⁽²⁾	Number of Exceedances 2017 (percentile in bracket) ⁽³⁾		
				15-minute Objective (266 µg/m ³)	1-hour Objective (350 µg/m ³)	24-hour Objective (125 µg/m ³)
GC	Industrial	98	98	4	1	0

Notes:

Exceedances of the SO₂ objectives are shown in **bold** (15-min mean = 35 allowed a year, 1-hour mean = 24 allowed a year, 24-hour mean = 3 allowed a year)

(1) Data capture for the monitoring period, in cases where monitoring was only carried out for part of the year.

(2) Data capture for the full calendar year (e.g. if monitoring was carried out for 6 months, the maximum data capture for the full calendar year is 50%).

(3) If the period of valid data is less than 85%, the relevant percentiles are provided in brackets.

- Local bias adjustment factor used
- National bias adjustment factor used
- Annualisation has been conducted where data capture is <75%
- Where applicable, data has been distance corrected for relevant exposure

Notes:

Exceedances of the NO₂ annual mean objective of 40µg/m³ are shown in **bold**.

NO₂ annual means exceeding 60µg/m³, indicating a potential exceedance of the NO₂ 1-hour mean objective are shown in **bold and underlined**.

(1) See Appendix C for details on bias adjustment and annualisation.

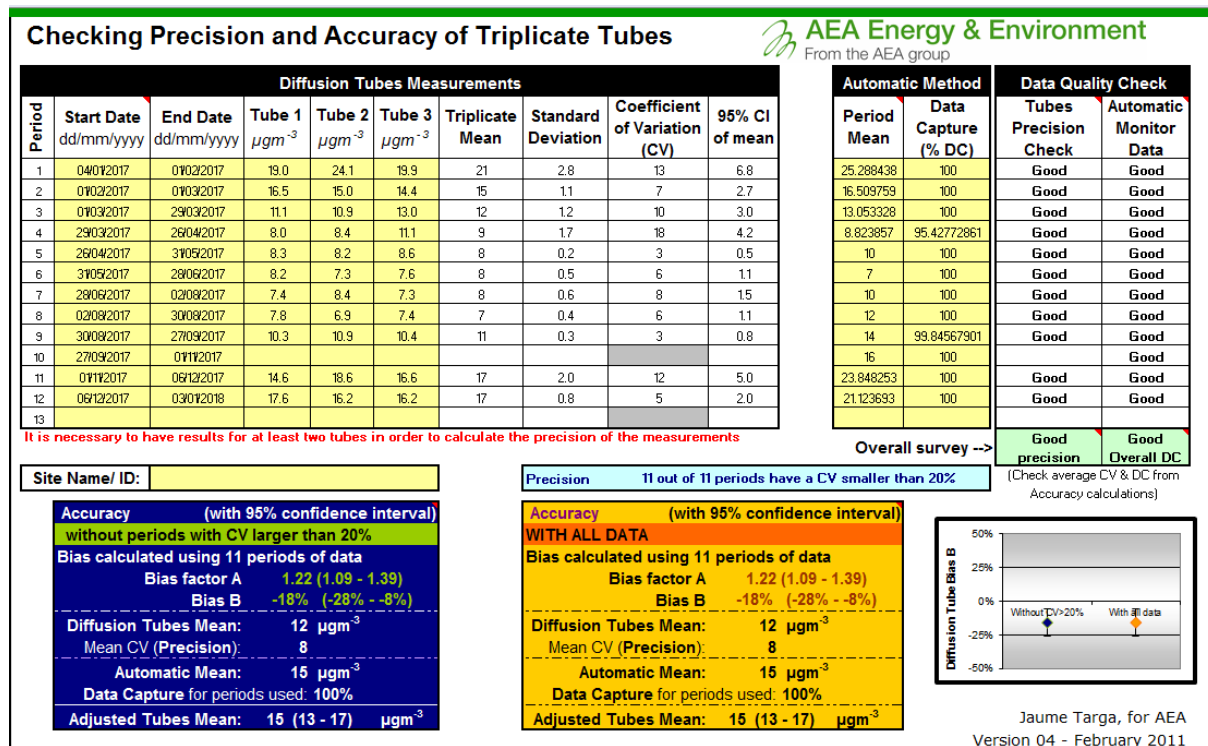

(2) Distance corrected to nearest relevant public exposure.

Appendix C: Supporting Technical Information / Air Quality Monitoring Data QA/QC

Diffusion Tube Local Bias Adjustment Factors

There is a set of triplicate diffusion tubes co-located with the Gainsborough Cemetery automatic monitoring station. A local bias adjustment factor of 1.22 has been calculated from the Precision and Bias Adjustment spreadsheet (v04)⁷, the outputs from the spreadsheet are shown in Figure C.1 below.

Figure C.1 – Local Bias Correction Output: Gainsborough Cemetery Automatic Monitoring Station

Diffusion Tube National Bias Adjustment Factors

The diffusion tubes for the year 2017 were supplied and analysed by Gradko International Limited, the tubes were prepared using the 50% Triethanolamine (TEA) in water preparation method. The national bias adjustment factor for Gradko 50% TEA is 0.97 (based on 22 studies, version 03/18) as derived from the national bias adjustment calculator⁸.

⁷

⁸ National Diffusion Tube Bias Adjustment Factor Spreadsheet version 06/17 available at <https://laqm.defra.gov.uk/bias-adjustment-factors/national-bias.html>

Discussion of Choice of Factor to Use

The diffusion tube data has been corrected using a bias adjustment factor, which is an estimate of the difference between diffusion tube concentration and continuous monitoring, the latter assumed to be a more accurate method of monitoring. LAQM.TG(16) provides guidance with regard to the application of a bias adjustment factor to correct diffusion tube monitoring. Triplicate co-location studies can be used to determine a local bias factor based on the comparison of diffusion tube results with data taken from NO_x/NO₂ continuous analysers. Alternatively, the national database of diffusion tube co-location surveys provides bias factors for the relevant laboratory and preparation method.

With regard to the application of a bias adjustment factor for diffusion tubes, the Defra Technical Guidance LAQM.TG(16) and the LAQM Helpdesk⁹ recommend the use of a local bias adjustment factor where available and relevant to diffusion tube sites.

The local bias adjustment factor of 1.22 derived from the co-location study at the Gainsborough Cemetery site has been used to adjust the diffusion tube data. The automatic monitor and co-located diffusion tubes recorded a high data capture (11 months data capture) within 2017 and were deemed as having good precision, therefore, it was decided to use the local bias adjustment factor of 1.22 for the 2017 diffusion tube data set.

Short-term to Long-term Data Adjustment

Data capture at all sites which recorded less than 75% data capture during 2017 has been annualised according to the method set out in LAQM TG(16) box 7.9. The details of the annualisation have been provided in Table C.1 below.

⁹ Laqm.defra.gov.uk

Table C.1 – Short-Term to Long-Term Monitoring Data Adjustment

Site	Uncorrected Diffusion Tube Mean ($\mu\text{g}/\text{m}^3$)	Barnsley Gawber AF	Sheffield AF	Nottingham AF	Average AF	Annualised Data Average $\mu\text{g}/\text{m}^3$	Annualised Bias Adjusted Concentration ($\mu\text{g}/\text{m}^3$)
WL14	15	0.848	0.939	0.909	0.899	13.0	15.9

QA/QC of Diffusion Tube Monitoring

The diffusion tubes for the year 2017 were supplied and analysed by Gradko International Ltd, the tubes were prepared using the 50% TEA in acetone preparation method. All results have been bias adjusted and annualised where required before being presented in Table A.3.

Gradko is a UKAS accredited laboratory and participates in the new AIR-PT Scheme (a continuation of the Workplace Analysis Scheme for Proficiency (WASP)) for NO₂ tube analysis and the Annual Field Inter-Comparison Exercise. These provide strict performance criteria for participating laboratories to meet, thereby ensuring NO₂ concentrations reported are of a high calibre. The lab follows the procedures set out in the Harmonisation Practical Guidance In the latest available AIR-PT results, AIR-PT AR 0018 (January to February 2017), AIR-PT AR019 (April to May 2017), AIR-PT AR021 (July to August 2017), AIR-PT AR022 (September to October 2017) and AIR-PT AR24 (January to February 2018). Gradko has scored 100% on all results. The percentage score reflects the results deemed to be satisfactory based upon the z-score of $< \pm 2$. All local Authority co-location studies in 2017 were rated as 'good' (tubes are considered to have "good" precision where the coefficient of variation of duplicate or triplicate diffusion tubes for eight or more periods during the year is less than 20%).

Appendix E: Summary of Air Quality Objectives in England

Table E.1 – Air Quality Objectives in England

Pollutant	Air Quality Objective ¹⁰	
	Concentration	Measured as
Nitrogen Dioxide (NO ₂)	200 µg/m ³ not to be exceeded more than 18 times a year	1-hour mean
	40 µg/m ³	Annual mean
Particulate Matter (PM ₁₀)	50 µg/m ³ , not to be exceeded more than 35 times a year	24-hour mean
	40 µg/m ³	Annual mean
Sulphur Dioxide (SO ₂)	350 µg/m ³ , not to be exceeded more than 24 times a year	1-hour mean
	125 µg/m ³ , not to be exceeded more than 3 times a year	24-hour mean
	266 µg/m ³ , not to be exceeded more than 35 times a year	15-minute mean

¹⁰ The units are in microgrammes of pollutant per cubic metre of air (µg/m³).

Glossary of Terms

Abbreviation	Description
AQAP	Air Quality Action Plan - A detailed description of measures, outcomes, achievement dates and implementation methods, showing how the local authority intends to achieve air quality limit values'
AQMA	Air Quality Management Area – An area where air pollutant concentrations exceed / are likely to exceed the relevant air quality objectives. AQMAs are declared for specific pollutants and objectives
ASR	Air quality Annual Status Report
Defra	Department for Environment, Food and Rural Affairs
DMRB	Design Manual for Roads and Bridges – Air quality screening tool produced by Highways England
EU	European Union
FDMS	Filter Dynamics Measurement System
LAQM	Local Air Quality Management
NO ₂	Nitrogen Dioxide
NO _x	Nitrogen Oxides
PM ₁₀	Airborne particulate matter with an aerodynamic diameter of 10µm (micrometres or microns) or less
PM _{2.5}	Airborne particulate matter with an aerodynamic diameter of 2.5µm or less
QA/QC	Quality Assurance and Quality Control
SO ₂	Sulphur Dioxide
